

WHEN THE LANDAU PEAK FALLS BETWEEN CONVOLUTION SAMPLES

Landau-Gaussian PDF | rows: Gaussian sigma | columns: Landau width | MPV = 0, area = 1

— legacy: 100 steps

— adjusted: ≥ 5 steps / Landau width

Each panel: $x = (\text{charge} - \text{MPV}) / (\text{Landau width} + \text{Gaussian sigma})$; PDF divided by its adjusted peak. Corner number = $\max |\text{legacy} - \text{adjusted}| / \text{adjusted peak}$.
